1. Introduction. Ingrown nails, or onychocryptosis, are a common problem encountered in primary care practice [1-3] which, when recurrent and painful, are often treated surgically. The disorder generally occurs in the great toes (Figure 1), although, rarely, fingernails are involved after trauma []. Patients with an ingrown

toenail are often in their second or third decade of life.

A New Surgical Technique for Ingrown Toenail

An alternative to this approach is the immediate definitive surgical reconstruction of the patient during the first operation for acute management of trauma.[9-12] The presence of concomitant body injuries, fear of postoperative infection, unavailability of surgical hardware and lack of surgical experience in the treatment of penetrating ...

Open surgical stabilization is the standard treatment for the majority of these complications. Percutaneous minimally invasive surgical stabilization of the fractures has become an accepted treatment method for the past several years. This study investigated the outcomes of percutaneous fixation of pelvic and acetabular fractures.

A traumatic bone cyst is an uncommon nonneoplastic lesion of the jaws that is considered as a "pseudocyst" because of the lack of an epithelial lining. This lesion is particularly asymptomatic and therefore is diagnosed by routine dental radiographic examination as a unilocular radiolucency with scalloped borders, mainly in the posterior mandibular region. The exact etiopathogenesis of the ...

Introduction. Globally, one of the most common causes of injuries that could pose threat to life is nonpenetrating trauma, also called as blunt force trauma, caused by road traffic accidents or various kinds of fallings.[1] In addition, the occurrence of multiple trauma around the world is an important issue, and the process of management of these patients is still a challenge from medical ...
