Because total laryngectomy and medical organ preservation protocols may not be acceptable to the patient from a quality of life standpoint, the authors emphasize that it is incumbent upon the head and neck surgeon to have a thorough understanding of all options available for treatment in the organ preservation paradigm for laryngeal cancer to provide the best oncologic and functional outcome.

Surgical preservation of laryngeal function is very challenging in patients with advanced SCCL, especially those of stage T4a. The purpose of this study was to assess the feasibility of organ preservation surgery for patients with T4a squamous cell carcinoma of the larynx (SCCL). We enrolled 32 patients with T4a SCCL and performed organ preservation surgery on them.

Organ-preservation surgery, combined chemotherapy and RT, and RTalone, allwith further surgery reserved for salvage, offer the potential for larynx preservation without compromising overall survival. Anticipated success rates for larynx preservation, associated toxicities, and suitability for a given patient will vary among these approaches.

The open organ preservation surgical procedures are an important part of the head and neck surgeon's armamentarium for treating laryngeal cancer. The principles of organ preservation surgery as they apply to laryngeal cancer must be thoroughly appreciated and strictly applied for oncologic and functional success.

There are two other new recommendations including the opinion, based on evidence of benefits vs. harms, that total laryngectomy rather than larynx preservation may be associated with better survival and quality of life in patients with extensive T3 lesions, large T4 lesions, or in those who have poor pretreatment laryngeal function.
