Protein Synthesis Occurs by Initiation, Elongation, and Termination An amino acid is brought to the ribosome by an aminoacyl-tRNA. Its addition to the growing protein chain occurs by an interaction with the tRNA that brought the previous amino acid. Key concepts • The ribosome has three tRNA-binding sites.

Protein Synthesis - Jones & Bartlett Learning

The synthesis of proteins takes two steps: TRANSCRIPTION and TRANSLATION. Transcription takes the information encoded in DNA and encodes it into mRNA, which heads out of the cell's nucleus and into the cytoplasm. During translation, the mRNA works with a ribosome and tRNA to synthesize proteins.

Translation During translation, or protein synthesis, the cell uses information from mRNA to produce proteins. Use a Genetic Code "Wheel" to identify the amino acid sequence a sequence of DNA will code for. For example: If your codon was GGU, the wheel would tell you that the amino acid sequence would be Glycine.
